

ABSTRACT OF THE DISCLOSURE

A workload on a user for selecting and arranging images used for album generation is reduced. Images necessary for generating an album are photographed and image data sets representing the images and accompanying information thereof are recorded in a recording medium. Data reading means reads the image data sets and the accompanying information. A template to be used for album generation is also read from template storing means. The images can be inserted in image insertion areas of the template in photographing order. With reference to the accompanying information, the images are inserted in the image insertion areas in photographing order and composite image data are generated. A printer prints the composite image data as the album.
